IMPORTANT NOTICE

January 2007

All plant ratings are based upon information currently available and are subject to change as new information is developed or new weed species are discovered and evaluated. Species rated "Q" are in accordance with the Assistant Director for Plant Industry Memorandum of January 1, 1980, entitled "Action Oriented Rating System", and Plant Industry Policy Letter 89-2, dated May 1, 1989.

The absence of a taxon on this list does not exonerate it as a potential pest plant. Taxa submitted to the Botany Laboratory/Herbarium (CDA) for identification are evaluated and given an A, B or C rating as specified from this list, are determined to be currently unrated (N-rated), or are given a Q or H (nursery grown material) rating (based on current evidence of potentially aggressive or invasive behavior). Cultivated material of extremely low likelihood of weediness and most native taxa are assigned a D rating, signifying that the taxon is deemed innocuous. Taxa assigned a Q or H rating are to be reviewed in a timely manner by the Pest Rating Committee and subsequently given a permanent rating (A, B, C, or N) which will appear on future versions of this list.

NOMENCLATURAL NOTE:

I. Current literature sources do not always agree on synonymy and name misapplication. On the following lists every attempt has been made to apply properly both the accepted and synonymized names. However, not all botanical references follow exactly these applications. "The Jepson Manual - Higher Plants of California" (Hickman ed., 1993) is here considered the primary source of accepted names for California. Exceptions occur only where clearly convincing taxonomic or nomenclatural evidence is contradictory, or important information is gained by utilizing an alternative treatment. Moreover, the synonymies provided are not meant to be exhaustive, with both these and the accepted names subject to change as new information or evidence becomes available.

Most authorship citations follow the Kew Abbreviation (Brummitt, R. K. and C. E. Powell, 1992. "Authors of Plant Names", Royal Botanic Gardens, Kew).

Explanations or taxonomic names immediately below a listed name are provided in technical format in order to communicate precisely and accurately alternative nomenclatural applications. True taxonomic or nomenclatural synonyms are supplied in brackets; later homonyms are referenced by the use of "non" between two alternative taxonomic authorities, with the first being responsible for the name applied in a given instance; misapplied non-synonyms are cited using "auct. non ____" between the epithet and taxonomic authority, meaning "in the sense used by other authors not in the sense of ____". The former cases (synonymy or homonymy) reference the taxon via a different taxonomic concept, an invalid name, or both. The latter misapplied names remain appropriately applied to a different taxon, although the validity or appropriate application of those names is not implied and must be assessed independently. The term "nec" indicates a third homonym was available; the term is equivalent to the English "also not" or "nor". The use of "sensu lato" means "in the broad taxonomic sense", while "pro parte" indicates that only a portion of the alternative taxon's variation is referable to the accepted name.
