

**PROGRESS REPORT ON 2006 FRESHWATER MOLLUSK  
FIELDWORK IN SIERRA NEVADA NATIONAL FORESTS,  
CALIFORNIA**

August 10, 2007

In 2006 we received a contract, # AG-91S8-C-05-0017, U. S. D. A. Forest Service, Region 5, to survey for freshwater mollusks in the Sierra Nevada in California. The geographic scope was to extend from the north in Lassen National Forest as far south as Lake Tahoe and including Sierra Nevada portions of Lassen, Plumas, Tahoe, and Eldorado National Forests. Primary emphasis was to be on federal Forest Service public lands, although other public lands, such as State Forests, and other sites as convenient could be included.

Target species were to include *Fluminicola* (pebblesnails), *Pyrgulopsis* (springsnails) and other springsnail taxa, as well as pleurocerids in the native genus *Juga*, particularly *J. (Calibasis) acutifilosa*, and other freshwater taxa known or thought to be rare or sensitive species according to Frest & Johannes (1995) or Forest Service listings under the Clinton Forest Plan (Frest & Johannes, 1999). As is evident from the Sierra Nevada Management Plan (SNEP, 1996-1997), the freshwater mollusks of this area are poorly known. Reference to Taylor (1981) indicates that only two, *Fluminicola turbiniformis* and *Juga (Oreobasis) nigrina*, has been reported previously. In a recent paper Lee *et al.* (2006) reported the Nevada Great Basin form *Juga interioris* from Lassen Volcanic National Park. Anatomical work by Hershler & Frest (1996) and Hershler (1999) indicated that the former taxon was likely to have a very small California Great Basin range and was unlikely to be present in the Sierra Nevada despite previous reports. Recent DNA phylogeny of *Fluminicola* species in the Upper Sacramento-Pit River systems (Hershler *et al.*, 2007) further revised the species and genus, with two major conclusions. The first was that numerous endemic taxa in this genus (in the broad sense: now known to be polyphyletic) were likely to occur in other drainages aside from the Upper Sacramento system within the genus' range, which was known to include the Sierra Nevada, albeit rarely (Taylor, 1981). Another result was further restriction of *Fluminicola turbiniformis sensu* Taylor, much as in Hershler & Frest (1996), which was supported by the DNA results. Further work on *Juga* species, both across the known range and in the Upper Sacramento drainage, indicates a similar proliferation of endemic new taxa in this pleurocerid group and much clarifies the status and occurrence of *Juga (Oreobasis) nigrina* (Campbell, Clarke, Frest & Johannes, in prep.: see also Campbell *et al.* (2006)). It is thus very unlikely that *nigrina* s.s. occurs in the Sierra Nevada. Similarly, the same work indicates that the Lassen Volcanic National Park report of *Juga interioris* is likewise mistaken.

However, prior to our Sierra Nevada field work, searches of museum collections and databases did indicate that previous sites for both *Juga* and for *Fluminicola* have been documented in the Sierra Nevada even if species ascriptions were erroneous. A few such sites were even reported from Lassen Volcanic National Park (see Frest & Johannes, 2007a and **Table 3** herein). We conducted field work for this project primarily in September, 2007 and will conduct further such work in summer of 2008. We collected a total of 117 sites during this survey. An additional 7 sites were included from previous surveys bring the total number of sites to 124 (see **Appendix A**). Thirty-two sites were found with living *Fluminicola* populations (26%), 21 sites were noted with living *Juga* (17%), and 6 sites had both genera present. Ninety-five sites are springs and 9 are spring influenced. Six sites were collected in Lassen Volcanic National Park, 60 in Lassen National Forest, 17 in Lassen National Forest inholding, 5 in Shasta-Trinity National Forest (administered by Lassen National Forest), 24 in Plumas National Forest, 1 in Plumas National Forest inholding, 5 in Latour Demonstration State Forest, and 5 in other (see **Table 2**). All sites are included on the map constituting **Figure 1** and are shown in **Appendix B**. Most sites were springs or spring meadows. As well as collecting and preserving the freshwater mollusks, we also measured some water quality criteria (see **Table 1**) and florally and physically described the sites (APPENDIX A. Parameters measured included temperature, pH, dissolved O<sub>2</sub> concentration, TDS, relative current velocity, conductivity, ORP, and turbidity. In the course of our travels in this extensive scope, we had the opportunity to collect for a single day in Lassen Volcanic National Park, 9/27/2007. Collecting was facilitated by the issue of permit #LAVO-2006-SCI-0032 . We collected six sites all situated in the southeastern part of the Park along the road to Drakesbad. Later that same day we collected additional sites to the E-SE outside of the Park. These Park sites are 85-90 and are described in **Appendix A** and mapped in **Appendix B** and **Figure 1** of the Lassen Volcanic National Park report (Frest & Johannes, 2007a). Water quality parameters are presented in tabular form on **Table 4** of the Lassen Volcanic National Park report (Frest & Johannes, 2007a). Three of the sites (86, 89, 90) lacked mollusks entirely: the remaining three (85, 87, 88) had either *Fluminicola* (87), *Juga* (88) or both (85) genera. The malacofauna is summarized in **Table 3** of the Lassen Volcanic National Park report (Frest & Johannes, 2007a). No other mollusks aside from these two genera were noted. Two taxa are represented, one each of *Fluminicola* and *Juga*. Both taxa are believed to represent undescribed (new) species. We were somewhat surprised to find these genera in such volcanic terrain, although the museum records lead us to believe there was a reasonable prospect.

**FIGURE 1. MAP OF SURVEY AREA IN NORTHERN SIERRA NEVADA.** Location of numbered mollusk sites (see Appendix A and Appendix B for details) in Lassen and Plumas National Forests. Map created with TOPO!® ©2006 National Geographic.

Distribution and rarity of the new finds will have to be determined by additional field work. Indications are that the Sierra Nevada may have numerous species in both genera, as proven in the Upper Sacramento system. Adjacent sites 91 and 92 (in the same drainage as the Park sites), for example, also have *Fluminicola* or *Juga*; but these appear to be different new taxa. DNA and anatomical studies, as well as additional field work will be necessary to resolve the status of the Sierra Nevada taxa. It is likely that pleurocerids and springsnails will be absent from large areas of the Park subject to recent vulcanism, hot or sulfur springs and other hydrothermal features, or recent land slides or other major disruptive natural processes. Nevertheless, it is highly likely that additional searches of Park springs and streams, including sites indicated on museum labels, will result in location of additional species or populations of both *Juga* and *Fluminicola*, at least some of which will likely be extremely precinctive taxa.

Some areas of special potential would be Kings Creek, Grassy Swale, Hot Springs Creek (all Warner Creek tributaries), and possibly upper Willow Creek.

As well as sites in Lassen National Volcanic Park, we also concentrated on some other areas in the northern part pf the Sierra Nevada, particularly Lassen National Forest and the northern parts of Plumas National Forest. 2007 field work will be concentrated mostly further south in Plumas National Forest, Eldorado National Forest, Lake Tahoe National Forest, and in the Lake Tahoe area. Because sites with *Juga* or *Fluminicola* were widely spread but not uncommon, it is not likely that we have found all sites. More intense field work in the same areas will be necessary for comprehensive coverage. We were also asked by the Forest Service to examine distribution of Sensitive freshwater mollusk species in the Lake Davis basin, including some sites previously visited by California Fish and Game personnel (see **Appendix C**). Results of this effort are summarized below and in Frest & Johannes (2007b).

- =sites with land snails
- ♦=not shown on 7.5' map
- =measurements not possible because flow was entirely boxed/piped or water too shallow, it was dry, or collected previous to this project

#### Habitat:

R=rheocrene (spring discharge in defined channel)

L=limnocrene (spring discharge into a pond or pool)

H=helocrene (spring similar to limnocrene, but marshy and comparatively shallow, not open pond or pool)

A=artesian

C=creek

R=river

In parentheses:

1=small

2=medium

3=large

s=spring influenced

- =sites with land snails
- ♦=not shown on 7.5' map
- =measurements not possible because flow was entirely boxed/piped or water too shallow, it was dry, or collected previous to this project

#### Modifications (cont.):

- d1=spring flow entirely diverted into ditch/canal
- d2=spring flow partially diverted into ditch/canal
- d3=spring run diverted by roadside ditch to culvert
- d4=spring ditched at source

#### Modifications:

no=none

pc1=pump chance above spring source

pc2=pump chance at spring source

pc3=pump chance below spring source

wt1=entire spring flow diverted to water tank

wt2=part of spring flow diverted to water tank

tr1=entire spring flow diverted to trough

tr2=part of spring flow diverted to trough

p1=entire flow of spring piped

p2=part of spring flow piped

bx1=spring source completely boxed

bx2=spring source partially boxed

df=spring converted into a drinking fountain or faucet

ca=spring capped

cu1=culvert above spring source

cu2=spring run with culvert below source

cu3=creek/river with culvert

br=bridge

cg=campground

#### Access:

- 1= road within 200 m
- 2= road not within 200 m

tr=trail

In parentheses:

pa=paved (concrete or asphalt)

gr=gravel

di=dirt

4=4WD road

a=road above

b=road below

#### Modifications:

- Connect (Connectivity to Drainage Basin):**
- c1=well connected to the drainage by permanent stream channel
- c2=connected by imppermanent stream channel
- c3=not well connected to the drainage (topography shows no obvious stream channel)
- c4=in a basin with no outlet

In parentheses:

dr=dry
